

Zeebrugge Port Tech Intelligence V2

This v2 turns the repository from a portfolio dashboard into a reproducible market-intelligence artifact: public sources, Firecrawl JSON outputs, APZI member-directory extraction, company-level stack proof and commercial software opportunities for Zeebrugge port logistics.

130

APZI member directory rows exported from public pages

22

Saved Firecrawl JSON outputs for APZI, port systems and vendor proof

12

Company-level vendor-proof rows with confidence and next action

45

Scraped seed-source extracts retained for reproducibility

Top Findings

Finding	Evidence level	Commercial implication
CSP Zeebrugge has the strongest observed terminal stack signal: Navis N4 plus yard/gate workflow evidence.	Observed	Best account for TOS-adjacent analytics, gate visibility and integration research.
ECS exposes a modern in-house logistics engineering stack through a public vacancy.	Observed	Strong target for API, BI, planning, WMS/TMS integration and data-platform conversations.
APICS, ZEDIS, IRP, NxtPort/RX-SeaPort and Terminal API form the strongest ecosystem-level layer.	Observed	Commercial tools should plug into port-community workflows, not replace them.
ICO, CLdN, DFDS and C.RO have strong operational complexity but limited named vendor proof.	Mixed	Highest-value research queue for vacancies, portals, customer docs and vendor cases.
Forwarders and shipping agents remain customs-software research targets.	Research target	Good segment for sales intelligence, customs automation and document-status tooling.

Top Opportunities

Opportunity	Best-fit buyer	Why now
Terminal stack intelligence	TOS vendors, integrators, consultants	Public proof is fragmented; account prioritization has value.
Yard and vehicle visibility	RoRo, automotive and container terminals	Vehicle, trailer and container movement evidence points to repeated status gaps.

Opportunity	Best-fit buyer	Why now
Customs release automation	Forwarders, customs brokers, ferry operators	IRP shifts release workflows toward software-provider integrations.
API/data readiness audit	Logistics operators and ports	Public webtech plus operational evidence can pre-score integration maturity.
Recruiter/manager proof pack	Hiring managers and commercial leaders	Saved JSON, CSV validation and screenshots make the work inspectable.

Evidence caution: observed labels are used only when a public source names the product/platform or workflow. Inferred labels remain explicitly marked as inferred or research targets.
